## Taxonomic studies of the fern genus *Lepidomicrosorium* Ching et Shing (Polypodiaceae) from China and neighboring regions

SHI Lei ZHANG Xian-Chun

(Institute of Botany, the Chinese Academy of Sciences, Beijing 100093)

**Abstract** The genus *Lepidomicrosorium* was separated from *Microsorium* Link by Ching and Shing in 1983. It is characterized by minute scattered sori covered with peltate and subsessile paraphyses when young. Tagawa detected that *Polypodium subhastatum* Baker, the type of this new genus, has this kind of paraphyses and thus transferred this species to *Neocheiropteris* Christ in 1952, a genus with divided lamina. During our study of the *Microsorioideae*, a revision of *Lepidomicrosorium* from China and neighboring regions is made on the basis of field and herbarium observation and evidence from anatomy, spore morphology, ecology, and distribution. *Lepidomicrosorium* is recognized as an independent genus and the demarcation line of its species is reconfirmed. Species with peltate scale-like paraphyses in *Microsorium* were transferred to *Lepidomicrosorium*. As a result, two species are recognized in this species, i. e. *L. buergerianum* (Miq.) Ching et Shing and *L. hymenodes* (Kunze) L. Shi et X. C. Zhang.

**Key words** *Lepidomicrosorium*; Taxonomy; China and neighboring regions

**摘要** 鳞果星蕨属是从星蕨属中划分出来的,其孢子囊群上幼时覆盖着近无柄的鳞片状隔丝。本文在研究星蕨亚科植物标本和野外考察的基础上,结合解剖学、孢粉学、生态学和植物地理学资料,对鳞果星蕨属植物作了修订。承认该属的独立性,并研究了有关种类的变异幅度,将星蕨属中有盾状隔丝的种类归入本属,承认鳞果星蕨和云南鳞果星蕨两个种。

**关键词** 鳞果星蕨属;分类;中国及邻近地区

鳞果星蕨属 *Lepidomicrosorium* Ching et Shing 是秦仁昌和邢公侠于 1983 年从星蕨属 *Microsorium* Link 分出的。1952 年,Tagawa 首次发现 *Polypodium subhastatum* Baker 的孢子囊群幼时被盾状隔丝,将其归入了扇蕨属 *Neocheiropteris*。1979 年,朱维明发表了有盾状隔丝的另一个种小果盾蕨 *Neolepisorus microsorioides* W. M. Zhu。秦仁昌和邢公侠认为这些处理都不恰当,他们通过对这一类群的形态比较研究,认为鳞果星蕨属不同于星蕨属之处在于叶片沿主脉下面有狭披针形的粗筛孔状的小鳞片,孢子囊群具隔丝;与盾蕨属不同之处在于附生,攀援,叶片为狭披针形或线状披针形,侧脉不明显,稍曲折,孢子囊群小而星散,具几无柄的盾状隔丝;与扇蕨属无近缘关系;本属与毛鳞蕨属

\* 国家自然科学基金资助项目。

1998-08-09 收稿。1998-11-14 收修改稿。

*Tricholepidium* Ching 最近,但根状茎上的鳞片腹部中央不具一簇深棕色粗毛,鳞片为披针形,孢子囊群的隔丝几无柄。因此,秦仁昌和邢公侠将主产于长江中游地区的这一群植物归入了鳞果星蕨属,并认为鳞果星蕨属可能是新近起源的,由星蕨属分化而出,特别是与攀援星蕨 *Microsorium buergerianum* 及其近缘种相近,区别只在于本属具盾状隔丝。其后,吴兆洪和秦仁昌(1991)又把该属归入瓦韦亚科 *Lepisorioideae*。1991年, Bosman 把它们归入薄唇蕨属 *Leptochilus*, 承认两个种: *L. buergerianus* (Miq.) Bosman 和 *L. subhemionitideus* (Christ) Bosman。Nooteboom (1997)将这一类群归并为星蕨属的一个种 *M. superficiale* (Bedd.) Ching, 包括了有盾状隔丝和无盾状隔丝的两个类型。

本文在研究广义的星蕨属植物标本和野外考察的基础上,结合解剖学、孢粉学、生态学和植物地理学资料,对鳞果星蕨属植物作了修订。承认属的概念,将星蕨属中有盾状隔丝的种类归入本属,并重新划定了种的界限,将鳞果星蕨属下的 23 个种和其它的一些名称归并为两个种。

## 1 主要分类性状分析

### 1.1 孢子囊群隔丝

本属植物与星蕨属中的近缘种如 *M. superficiale* (Bl.) Ching 的主要区别在于具有盾状隔丝;与同样具盾状隔丝的盾蕨属的区别在于本属植物为附生,隔丝具短柄;与也具有盾状隔丝的毛鳞蕨属的区别则在于本属植物根状茎上的鳞片不具一簇深棕色粗毛。

### 1.2 叶片形态

本类群形态变化很大,如峨眉山从海拔 900~1900 m 的范围内,就有 8 种 1 变种 (Ching & Shing, 1983)。特别是 *M. buergerianum* (Miq.) Ching, 从树干的基部向上攀援生长,叶形逐渐变狭窄。本属可分为两种类型:一种为叶短于 10 cm,披针形或三角形,基部宽或呈心形;另一种叶长过 20 cm,长披针形,基部渐狭或呈楔形。

### 1.3 叶质

根据叶质和叶片侧脉清晰度分为两种类型:一种为厚纸质,侧脉不明显;另一种草质,侧脉明显。

### 1.4 根状茎横切面

根状茎的横切面可分为两种类型:一种只具环形维管束;另一种具环形维管束或也具有少量星散的厚壁组织(图 1)。

### 1.5 孢子形状

扫描电镜观察到鳞果星蕨属植物的孢子为圆肾形,外壁纹饰瘤块状(图 2)。

## 2 生态特性

本属植物均为攀援植物,孢子体的初期发育于林下土壤中,而后长出细长的根状茎,爬向树干基部并向上攀援,高可达 2~3 m,有时也附生于林荫石壁上,根状茎紧贴于树干或石壁上,上面密生鳞片,叶远生,下部叶均较宽,逐渐向上,叶呈狭披针形。喜生于海拔 600~2000 m 空气潮湿而流动性不大的阴凉的山地次生林中。

## 3 植物地理分布

在地理分布上,本属主要分布于中国西南部和中部的山地次生林(表 1,图 3 和图 4)。

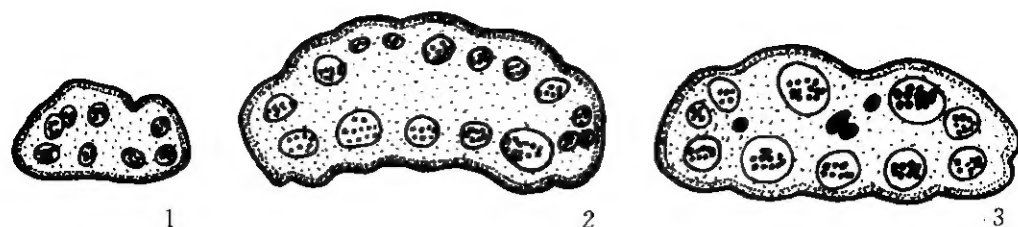

图1 根状茎横切面 1. *Lepidomicrosorium buergerianum* (X. S. Zhang & Y. X. Ren 7596), 示环形维管束; 2. *L. hymenodes* (S. K. Wu 4180), 示环形维管束鞘; 3. *L. hymenodes* (Sino-Russia Yunnan Exped. 1122), 示环形维管束和少量厚壁组织。(1, 2, 3.  $\times 15$ )

Fig. 1 The cross section of the rhizome of *Lepidomicrosorium*. 1. *L. buergerianum* (X. S. Zhang & Y. X. Ren 7596), with circumvascular sheaths in the cortex only; 2. *L. hymenodes* (S. K. Wu 4180), with circumvascular sheaths in the cortex only; 3. *L. hymenodes* (Sino-Russia Yunnan Exped. 1122), with circumvascular sheaths and scattered strand of sclerenchyma in the cortex. (1, 2, 3.  $\times 15$ )

分布区从浙江、江西、台湾、湖北、湖南、广东、广西到四川、贵州、云南和西藏,特别是四川峨眉山,从海拔 900m 至 2000 m 均有本属植物的分布,且形态变异很大,是本属的发育中心。日本、越南、尼泊尔和印度也有分布。

表1 鳞果星蕨属 2 个种的地理分布

Table 1 Distribution of two *Lepidomicrosorium* species

Species	China											Japan	Vietnam	Nepal	India
	1	2	3	4	5	6	7	8	9	10	11				
<i>L. buergerianum</i>	+	+	+	+	+			+	+	+		+	+		
<i>L. hymenodes</i>				+	+	+	+	+	+	+	+	+	+	+	+

1. Zhejiang; 2. Jiangxi; 3. Taiwan; 4. Hubei; 5. Hunan; 6. Guangdong; 7. Guangxi; 8. Sichuan; 9. Guizhou; 10. Yunnan; 11. Xizang.

#### 4 系统发育

同意秦仁昌和邢公侠(1983)认为的本属晚近起源于星蕨属的观点,特别是与褐叶星蕨(*M. superficiale*)及其近缘种,唯一区别是本属植物的孢子囊群幼时被盾状隔丝。

#### 5 鳞果星蕨属植物的分类

##### 鳞果星蕨属

*Lepidomicrosorium* Ching et Shing, Ching et Shing, Bot. Res. Contrb. Inst. Bot. Inst. Acad. Sin. 1: 1. 1983; S. H. Wu et Ching, Fam. Gen. Pterid. China 519. 1991; R. J. Johns, Ind. Fil. Suppl. 195. 1996; 52. 1997. TYPE: *Lepidomicrosorium buergerianum* (Miq.) Ching et Shing ex S. X. Xu (*Polypodium buergerianum* Miq. 1967) = *Lepidomicrosorium subhastatum* (Baker) Ching (*Polypodium subhastatum* Baker 1889).

中小型附生植物。根状茎长,攀援于树干或岩石上,顶部无叶,呈鞭状,密被鳞片,鳞片红棕色,披针形,长渐尖头,透明,具粗筛孔,边缘有疏齿。叶疏生,中肋下面有一、二狭披针形的粗筛孔小鳞片,有柄,叶片多变,披针形或戟形,基部楔形或心形,边缘全缘或有时波状或撕裂;叶纸质,网状,有内藏小脉。孢子囊群圆形,多星散分布于中肋两侧呈不规则排列,幼时有隔丝覆盖,隔丝盾状,几无柄,具透明粗筛孔,随孢子囊发育而早落。孢子

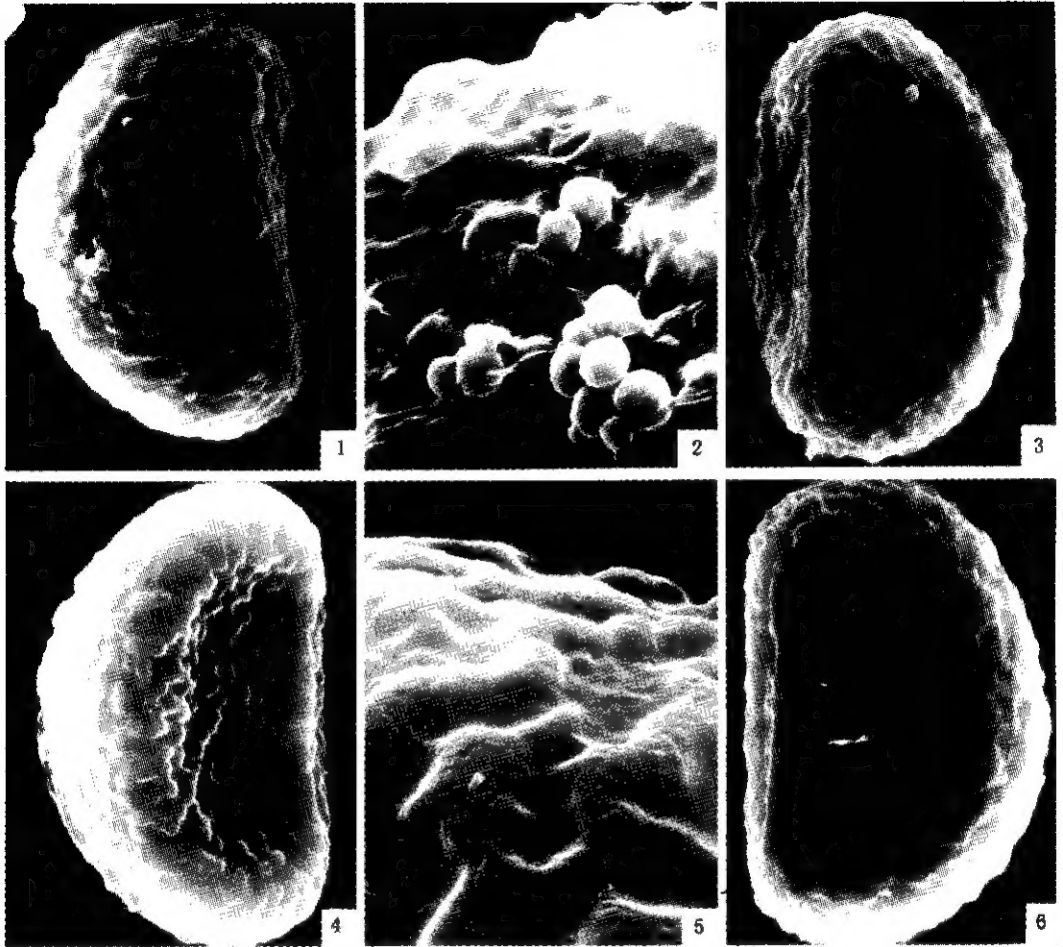

图2 鳞果星蕨属孢子扫描电镜照片 1,2,3. 鳞果星蕨; 4,5,6. 云南鳞果星蕨。

Fig.2 SEM photographs of spores 1,2,3. *Lepidomicrosorium buergerianum*;  
4,5,6. *L. hymenodes*. (1,2,3. R. C. Ching 106; 4,5. Y. Tsiang 4324; 6. W. P. Fang 2493)  
(1,3.  $\times 1020$ ; 2.  $\times 4800$ ; 4,6.  $\times 1020$ ; 5.  $\times 4800$ ).

圆肾形,外壁纹饰瘤块状。

本属2种,主产于中国西南部和中部地区。日本、越南、尼泊尔和印度也有分布。

越南也有分布。攀援于林中树干上或附生于岩石上。海拔 450~2000 m。

过去本种植物一直应用 *Polypodium subhastatum* 的名字, 经研究比较 *P. buergerianum* 的模式照片, 我们同意 Bosman (1991) 和 Nakaike (1992) 将 *P. subhastatum* 并入 *P. buergerianum* 的观点。

本种形态和大小变化很大(图 6), 孢子体的初期发育于林下的土壤中, 长出细长的根状茎后, 就从树干基部向上攀援, 高达 2~3 m, 有时也附生于林荫石壁上, 喜生于海拔 450~2000 m 空气潮湿而流动性不大的阴凉的山地次生林中。树干下部生长的叶片多呈常春藤形, 叶的基部均比较宽, 或呈阔心形; 攀援于树干上部满布孢子的叶片多呈披针形, 叶的基部截形。其中还有许多中间类型。有的叶基部有羽裂现象, 可能是与叶基部羽裂物种杂交的结果。

Takei (1983) 报道了产自日本的 *M. buergerianum* 的染色体数目  $2n=108$  和  $2n=144$ ; 被认为是四倍体的 *Neocheiropteris subhastata* 的染色体数目  $2n=144$ 。1992 年, Nakaike 也报道了 *M. buergerianum* 的染色体数目为  $2n=144$ 。本种分布集中, 叶形变化大, 显然是一个复杂的类群, 需要作进一步的研究。

## 5.2 云南鳞果星蕨(新拟) 图 7

图 6 鳞果星蕨的叶片形态 ( $\times 1/4$ )Fig. 6 The leaf morphology of *Lepidomicrosorium buergerianum* ( $\times 1/4$ )***Lepidomicrosorium hymenodes* (Kunze) L. Shi et X. C. Zhang, comb. nov.**

*Polypodium hymenodes* Kunze, Linnaea 23: 279. 1850; Mett., Fil. Hort. Lips. 37. 1856, t. 25, f. 40~41; Takeda, Notes Roy. Bot. Gard. Edinb. 8: 287. 1915; C. Chr., Ind. Fil. Suppl. 54. 1917; Acta Horti. Goteberg. 1: 101. 1924. — *Polypodium hymenodes* var. *sparsiorum* Takeda, Notes Roy. Bot. Gard. Edinb. 8: 287. 1915. — *Microsorium hymenodes* (Kunze) Ching, Bull. Fan Mem. Inst. Biol. 4: 301. 1933; Ic. Fil. Sin. 2: 84. pl. 84, 1934; H. Ito, J. Jap. Bot. 11(2): 96. 1935; C. Chr. et Tardieu, Not. Syst. 8: 194. 1939; Tardieu et C. Chr. In Lecomte, Fl. Indo-Chine 7(2): 481. 1941; Copel., Gen. Fil. 197. 1947; S.H. Fu, Ill. Import. Chin. Pl. Pterid. 227. 1957; Ic. Corm. Sin. 1: 261. 1972; V. G. Tu, Novosti Sist. Vyssh. Rast. 13: 20. 1981; Ching et S.K. Wu in Fl. Xizang. 1: 328. 1983; C.K. Satija et S.S. Bir, Polyp. Ferns India 74. 1985; S. X. Xu in Fl. Jiangxi 1: 340. 1993; S. F. Wu in W. T. Wang, Keys Vasc. Pl. Wuling Mts. 72. 1995. TYPE: China. Yunnan, Mengzi, Henry 9265B (lectotype).

*Polypodium subhemionitideum* Christ, Bull. Herb. Boissier 7: 5. 1899. — *Leptochilus subhemionitideus* (Christ) Bosman, Monogr. Microsorium, Leiden Bot. Ser. 14: 117. f. 27, 1991. syn. nov. TYPE: China. Yunnan, Mengzi, Henry 9265B (P, isotype B, K, PE).

*Polypodium superficiale* var. *attenuatum* Rosenst., Feddes Repert. Spec. Nov. Reg-

日本、尼泊尔和印度也有分布。攀援于林中树干上或附生于岩石上。海拔 700~2000 m。

基于秦仁昌(1933)的星蕨属植物无鳞片状隔丝的概念,将具鳞片状隔丝的鳞果星蕨属从星蕨属分出来。鳞果星蕨属植物同外形极似而无鳞片状隔丝的褐叶星蕨 *M. superficiale* 显然不同,同毛鳞蕨属植物不同在于后者根状茎上鳞片下面中央具有一簇深棕色粗毛。

致谢 感谢邢公侠教授审阅文稿并提出宝贵意见。
